

Mobile Sales Project Report

Prepared by: Ritesh Kumar

Data Source: Mobile Sales Data.xlsx

Executive Summary

This project analyzes mobile sales performance to identify revenue drivers, consumer purchasing behaviors, and geographical trends. The analysis was conducted using Power BI, resulting in an interactive dashboard that tracks critical Key Performance Indicators (KPIs) such as Total Sales, Transaction volume, and Average Pricing.

Technical Workflow & Methodology

The development of this Power BI report followed a structured data analysis pipeline:

- 1. Data Understanding & Cleaning:**
 - Imported the raw dataset (Mobile Sales Data.xlsx) into Power BI.
 - Performed data profiling and cleaning in Power Query to ensure data type consistency, remove anomalies, and prepare the dataset for accurate modeling.
- 2. Data Modeling & Custom Calendar:**
 - Generated a **Custom Calendar Table** to enable robust time-intelligence analysis.
 - Utilized the Data Model tab to create active relationships between the primary sales fact table and the dimension tables (e.g., Dates, Products, Geography).
- 3. DAX Calculations:**
 - Formulated fundamental Data Analysis Expressions (DAX) to calculate dynamic measures. Key calculated measures include:
 - **Total Sales:** 769.2M
 - **Total Transactions:** 4K
 - **Total Quantity Sold:** 19.2K
 - **Average Price:** 40.1K
- 4. Dashboard Creation:**
 - Designed an interactive UI prioritizing user experience.
 - Implemented custom slicers (Month, Mobile Model, Payment Method, Brand) utilizing the "Edit Interactions" feature to ensure seamless cross-filtering across visuals.

Key Insights & Findings

- **Revenue & Volume:** The business processed 4,000 transactions, moving 19.2K units to generate a total sales volume of 769.2M, with an average unit price of 40.1K.
- **Temporal Trends:** Sales quantities experienced notable volatility throughout the year. The highest sales volumes were recorded in **July (1,700 units)** and **March (~1,696 units)**, while February saw a sharp decline (45 units).
- **Payment Preferences:** Consumer payment methods are highly balanced. Transactions are evenly distributed across Cash (24.72%), UPI (24.69%), Credit Card (26.36%), and Debit Card (24.22%), indicating no significant bottleneck in payment infrastructure.
- **Product Performance:** The **iPhone SE** and **OnePlus Nord** emerged as the top-performing mobile models by total sales, closely followed by the Galaxy Note 20 and

Vivo Y51.

- **Geographical Distribution:** The map visualization indicates a strong market presence across major Indian metropolitan and tier-2 cities, including Delhi, Mumbai, Bangalore, Chennai, and Lucknow.
